RISK ASSESSMENT

ALGORITHM

1. Start
2. Input the Likelihood of the hazard in a scale of 1 to 5.
3. Input the Consequence of the hazard in a scale of 1 to 5.
4. Calculate the RiskScore by multiplying the Likelihood with the Consequence (RiskScore = Likelihood*Consequense).
5. Compare the RiskScore, if it is between 1 and 4, then classify it as Low.
6. If the RiskScore is between 5 and 9, then classify it as Medium.
7. If the RiskScore is between 10 and 16, then classify it as High and display a warning.
8. If the RiskSore is between 17 and 25, then classify it as Critical and display a warning.
9. Output the RiskScore and the classification.
10. End.

FLOWCHART

PSEUDOCODE

```
BEGIN
